### 3. The Tangent Space

Definition 3.1 A tangent vector at  $p \in M$  is a function

$$v_p : C^\infty(M) \longrightarrow \mathbb{R}$$

such that

$$v(af + g) = av(f) + bv(g)$$

for all  $a \in \mathbb{R}$  and  $f, g \in C^\infty(M)$ , and

$$v_p(fg) = g(p)v(f) + f(p)v(g)$$

for all  $f, g \in C^\infty(M)$ .

The tangent space at  $p$  is the set of all tangent vectors at  $p$  and is denoted by  $T_p M$ .

Example 3.2 Let  $(\varphi, U)$  be a chart that contains  $p \in M$ . Then\*

$$\partial_i|_p(f) := \partial_i(f \circ \varphi^{-1})(\varphi(p)) = \left. \frac{\partial}{\partial x^i}(f \circ \varphi^{-1}) \right|_{x=\varphi(p)}$$

\* On the RHS,  $\partial_i = \frac{\partial}{\partial x^i}$  is the usual partial derivative defined by the Cartesian coordinates  $x = (x^1, \dots, x^n)$  on  $\mathbb{R}^n$  that cover the image of the chart  $\varphi(U) \subset \mathbb{R}^n$ .

is a tangent vector at  $p$ . (Hw: Verify this statement).

Lemma 3.3 Suppose  $v_p \in T_p M$ .

(i) If  $f, g \in C^\infty(M)$  are equal on an open neighborhood of  $p$ , then

$$v_p(f) = v_p(g).$$

(ii) If  $h \in C^\infty(M)$  is constant on an open neighborhood of  $p$ , then

$$v_p(h) = 0.$$

Proof

(i) Suppose  $V$  is an open neighborhood of  $p$  such that

$$f|_V = g|_V$$

Then

$$h := f - g$$

satisfies

$$h|_V = 0$$

Next let  $\chi \in C^\infty(M)$  be a cutoff function satisfying

$$0 \leq \chi \leq 1, \quad \text{supp } \chi \subset V \quad \text{and} \quad \chi|_V = 1$$

where  $V \subset U$  is an open neighborhood of  $p$ . Then  $\chi h = 0$  and we have that

$$V_p(\chi h) = 0$$

follows by linearity of the map  $V_p : C^\infty(M) \rightarrow \mathbb{R}$ .

By the Leibnitz property of tangent vectors, we get that

$$0 = V_p(\chi h) = \overset{\text{I}}{\cancel{\chi(p)}} V_p(h) + \overset{\text{O}}{\cancel{h(p)}} V_p(\chi),$$

and so

$$V_p(h) = 0 \iff V_p(s) = V_p(g).$$

(ii) Suppose that  $h \in C^\infty(M)$  is constant in an open neighborhood of  $p \in M$ . Then by (i) we can, without loss of generality, assume that

$$h = c \text{ on } M$$

for some  $c \in \mathbb{R}$ . Noting that

$$V_p(I) = V_p(1 \cdot I) = I V_p(1) + 1 V_p(I) = 2V_p(I),$$

we see that

$$V_p(I) = 0.$$

Since

$$h = c \cdot 1,$$

it follows that

$$V_p(h) = V_p(c \cdot 1) = c V_p(1) = 0.$$

□

Theorem 3.4 Suppose that  $(U, \varphi)$  is a chart containing  $p \in M$ . Then

$$\{ \partial_1|_p, \dots, \partial_n|_p \}$$

is a basis of  $T_p M$ . Moreover,

$$V_p = V_p(\varphi^i) \partial_i|_p \quad (\varphi = (\varphi^1, \dots, \varphi^n))$$

for all  $V_p \in T_p M$ .

Proof

Without loss of generality, we assume that

$$\varphi(p) = 0$$

and

$$\varphi(U) = B_R(0)$$

for some  $R > 0$ . Next, suppose that  $f \in C^\infty(M)$  and define

$$\tilde{f} = f \circ \varphi^{-1} \in C^\infty(B_R(0)).$$

Observing that

$$\tilde{f}(x) = f(p) + \tilde{f}_i(x)x^i$$

where

$$\tilde{f}_i(y) = \int_0^1 \frac{\partial f}{\partial x^i}(ty) dt,$$

we can write  $f$  as

$$f = f(p) + \tilde{f}_i \varphi^i \quad (3.1)$$

where

$$\varphi(q) = (\varphi^1(q), \dots, \varphi^n(q))$$

and

$$\tilde{f}_i = \tilde{f}_i \circ \varphi$$

Applying  $\partial_j|_p$  to (3.1) gives

$$\begin{aligned} \partial_j|_p f &= \cancel{\partial_j|_p \tilde{f}_i(p)} + \left( \varphi^i(p) \overset{\circ}{\partial}_j|_p (\tilde{f}_i) + \tilde{f}_i(p) \partial_j|_p (\varphi^i) \right) \\ &= \tilde{f}_i(p) \underbrace{\frac{\partial x^i}{\partial x_j}}_{\partial_j|_p} = \tilde{f}_j(p). \end{aligned}$$

So

$$v_p(f) = \left( v_p(f_i) \frac{\partial}{\partial \varphi^i}(\varphi) + f_i(\varphi) v_p(\varphi^i) \right)$$
$$= v_p(\varphi^i) \frac{\partial}{\partial \varphi^i}|_p f,$$

and we conclude that

$$v_p = v_p(\varphi^i) \frac{\partial}{\partial \varphi^i}|_p.$$

### Notation 3.5

Given a chart  $(U, \varphi)$  on a manifold  $M$ , we will also denote the tangent vector  $\frac{\partial}{\partial \varphi^i}|_p$  by

$$\frac{\partial}{\partial \varphi^i}|_p = \frac{\partial}{\partial \varphi^i}|_p$$

where  $\varphi = (\varphi^1, \dots, \varphi^n)$ .

Given a smooth function  $f \in C^\infty(M)$ , we will often write

$$\frac{\partial f}{\partial \varphi^i}|_p := \frac{\partial}{\partial \varphi^i}(f \circ \varphi^{-1})(\varphi(p))$$

## 4. The Tangent Map and Tangent Bundle

Definition 4.1 Suppose  $\Phi: M \rightarrow N$  is a smooth map and  $p \in M$ . Then the linear map

$$T_p f: M \rightarrow N : v_p \mapsto T_p(v_p)$$

defined by

$$T_p(v_p)(f) = v(f \circ \Phi) \quad \forall f \in C^\infty(N)$$

is called the tangent map.

Proposition 4.2 (Chain Rule)

Suppose  $\Phi: M \rightarrow N$  and  $\Psi: N \rightarrow P$  are smooth maps. Then

$$T_p(\Psi \circ \Phi) = T_{\Phi(p)} \Psi \circ T_p \Phi$$

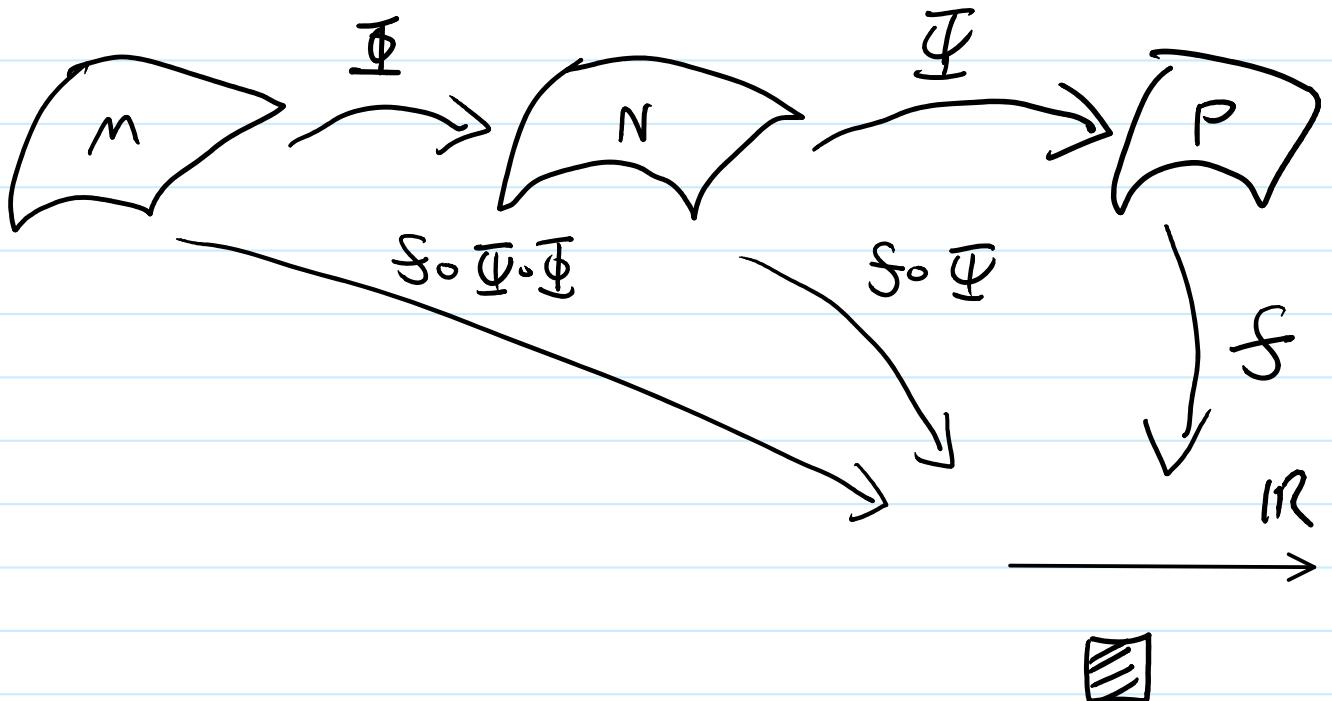

Proof Suppose that  $f \in C^\infty(M)$  and  $v_p \in T_p M$ .  
Then

$$T_p(\bar{\Psi} \circ \bar{\Phi})(v_p)(f) = v_p(f \circ \bar{\Psi} \circ \bar{\Phi})$$

$$\begin{aligned}
 &= \underbrace{T_p \bar{\Phi}(v_p)}_{\in T_{\bar{\Phi}(p)} M} (f \circ \bar{\Phi}) \\
 &= T_{\bar{\Phi}(p)} \bar{\Phi} (T_p \bar{\Phi}(v_p))
 \end{aligned}$$

shows that

$$T_p(\bar{\Psi} \circ \bar{\Phi}) = T_{\bar{\Phi}(p)} \bar{\Phi} \circ T_p \bar{\Phi}.$$

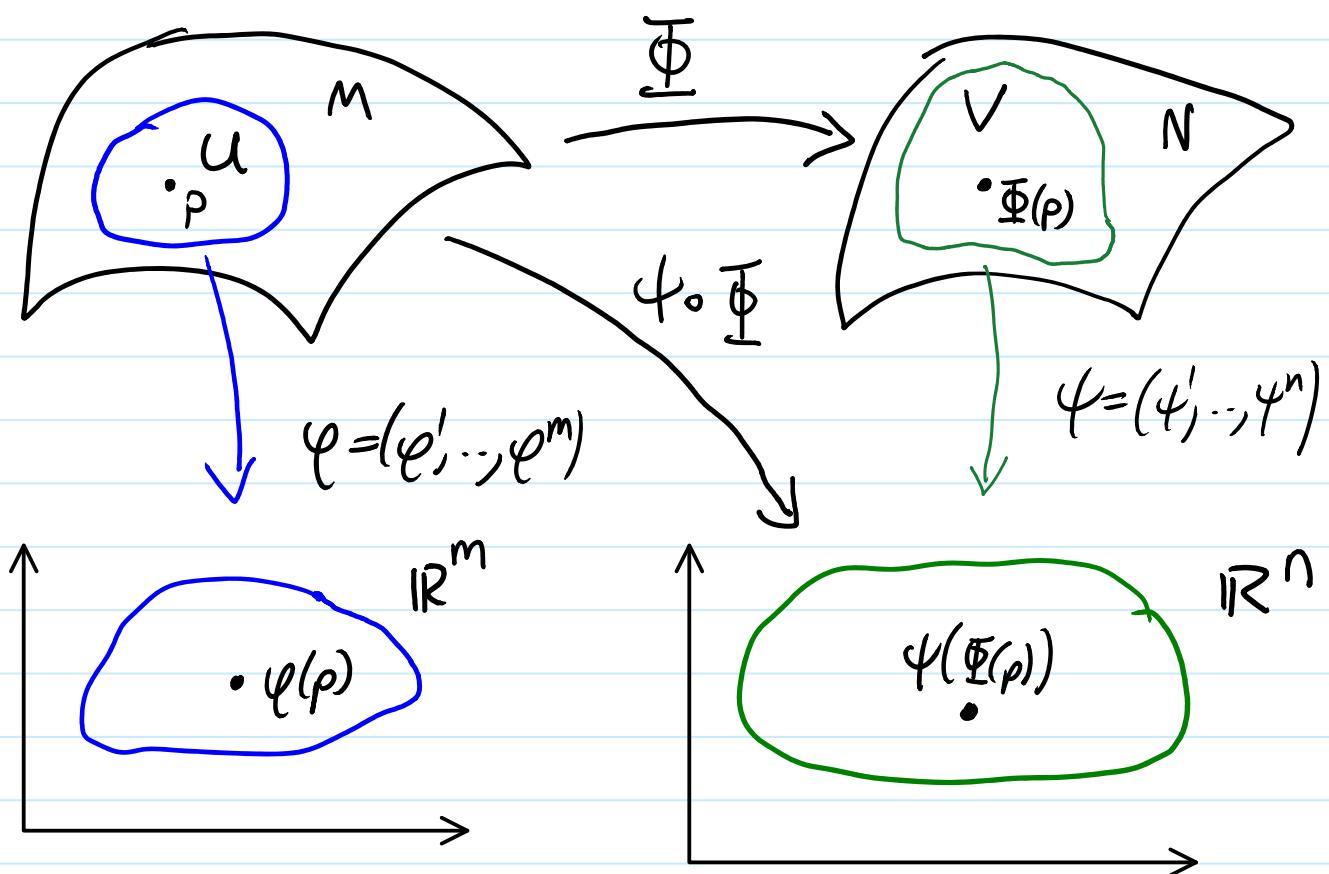

Proposition 4.3 Suppose  $\bar{\Phi}: M \rightarrow N$  is smooth,  $(U, \varphi = (\varphi^1, \dots, \varphi^m))$  is a chart containing  $p \in M$  and  $(V, \psi = (\psi^1, \dots, \psi^n))$  is a chart containing  $\bar{\Phi}(p)$ . Then

$$T_p \bar{\Phi} \left( \frac{\partial}{\partial \varphi^j} \Big|_p \right) = \frac{\partial \bar{\Phi}^i}{\partial \varphi^j} \Big|_p \frac{\partial}{\partial \psi^i} \Big|_{\bar{\Phi}(p)} \quad j=1, \dots, m$$

where

$$\bar{\Phi}^i = \psi^i \circ \bar{\Phi}.$$

Proof:

Suppose  $f \in C^\infty(M)$ . Then

$$T_p \bar{\Phi} \left( \frac{\partial}{\partial \varphi_j} \right) (f) = \frac{\partial}{\partial \varphi_i} \Big|_p \left( f \circ \bar{\Phi} \right) \quad \begin{array}{l} \text{(by def of the} \\ \text{of the tangent map)} \end{array}$$

$$= \partial_j (f \circ \bar{\Phi} \circ \bar{\varphi}^{-1})(\varphi(p)) \quad \begin{array}{l} \text{(by def of } \frac{\partial}{\partial \varphi_i}|_p \text{)} \end{array}$$

$$= \partial_j (f \circ \bar{\varphi}^{-1} \circ \varphi \circ \bar{\Phi} \circ \bar{\varphi}^{-1})(\varphi(p))$$

$$= \partial_i (f \circ \bar{\varphi}^{-1}) (\varphi \circ \bar{\Phi} \circ \bar{\varphi}^{-1} \circ \varphi(p)) \quad \partial_j (f \circ \bar{\Phi} \circ \bar{\varphi}^{-1})(\varphi(p))$$

↑  
by the ordinary chain rule from calculus

$$= \partial_i (f \circ \bar{\varphi}^{-1})(\varphi(\bar{\Phi}(p))) \quad \partial_j (\varphi^i \circ \bar{\Phi} \circ \bar{\varphi}^{-1})(\varphi(p))$$

$$= \frac{\partial}{\partial \varphi_i} \Big|_{\bar{\Phi}(p)} (f) \frac{\partial \bar{\Phi}^i}{\partial \varphi_j} \Big|_p.$$

↑  
by def of  $\frac{\partial}{\partial \varphi_i}|_{\bar{\Phi}(p)}$  and  $\frac{\partial \bar{\Phi}^i}{\partial \varphi_j}|_p$  where  $\bar{\Phi}^i = \varphi^i \circ \bar{\Phi}$ .

Since  $f$  was chosen arbitrarily, we conclude that

$$T_p \bar{\Phi} \left( \frac{\partial}{\partial \varphi_j} \right) = \frac{\partial \bar{\Phi}^i}{\partial \varphi_j} \Big|_p \frac{\partial}{\partial \varphi_i} \Big|_{\bar{\Phi}(p)} \quad j=1, 2, \dots, m$$

## Definition 4.4 The set

$$TM = \bigcup_{p \in M} T_p M$$

is called the tangent bundle, and the map

$$\pi: TM \rightarrow M$$

defined by

$$T_p M \ni v_p \mapsto \pi(v_p) = p \in M$$

is known as the projection map.

For  $\Phi \in C^\infty(M, N)$ , the tangent map

$$T\Phi: TM \rightarrow TN$$

is defined by

$$T\Phi(v_p) := T_p \Phi(v_p) \quad \forall v_p \in T_p M, p \in M.$$

## Proposition 4.5 (Chain rule again)

Suppose  $\Phi \in C^\infty(M, N)$ ,  $\Psi \in C^\infty(N, P)$ .

Then

$$T(\Psi \circ \Phi) = T\Psi \circ T\Phi$$

Proof

Fix  $v_p \in T_p M \subset \overline{T}M$ . Then

$$T(\Psi \circ \Phi)(v_p) = \overline{T_p}(\Psi \circ \Phi)(v_p) \text{ by def of } T(\Psi \circ \Phi)$$

$$= \overline{T_{\Phi(p)}} \Psi(T_p \Phi(v_p)) \text{ by Prop. 4.2}$$

$$= \overline{T_{\Phi(p)}} \Psi(\overline{T\Phi}(v_p)) \text{ by def of } \overline{T\Phi}$$

$$= \overline{T\Psi}(\overline{T\Phi}(v_p)) \text{ by def of } \overline{T\Psi}$$

$$= \overline{T\Psi} \circ \overline{T\Phi}(v_p).$$

Since this holds for all  $v_p \in T_p M$  and  $p \in M$ , it follows that

$$\overline{T(\Psi \circ \Phi)} = \overline{T\Psi} \circ \overline{T\Phi}$$

### Exercise 4.6

If  $\text{id}_M$  is the identity map on a manifold  $M$ . Show that

$$T\text{id}_M = \text{id}_{TM},$$

where  $\text{id}_{TM}$  is the identity map on the tangent bundle  $TM$ .

### Exercise 4.7

If  $\Phi \in C^\infty(M, N)$  is a diffeomorphism, show that

$$T\Phi: TM \rightarrow TN$$

is bijective and also that

$$(T\Phi)^{-1} = T(\Phi^{-1}).$$

### Exercise 4.8

Suppose  $U \subset \mathbb{R}^n$  is an open set. Then  $(U, \xi)$ , where  $\xi = \text{id}|_U$  and

$\text{id}: \mathbb{R}^n \rightarrow \mathbb{R}^n$  is the identity map, defines a global chart on  $U$ . With respect to this chart, the basis vectors

$\partial_i|_x \in T_x U$   $i=1, 2, \dots, n$  are well defined for each  $x \in U$ . Given  $v_x \in T_x U$ , let  $v_x = v_x^i \partial_i|_x$

be the unique expansion for  $v_x$  in terms of the basis  $\{\partial_i|_x\}_{i=1}^n$ . Show that the map

$$\lambda: TU \rightarrow U \times \mathbb{R}^n$$

determined by

$$\lambda(v_x) = (x, v_x^1, \dots, v_x^n) \quad \forall v_x \in T_x U$$

is well-defined and bijective. Moreover, show that

$$\lambda|_{T_x U}: T_x U \rightarrow \{x\} \times \mathbb{R}^n \cong \mathbb{R}^n$$

is a (linear) isomorphism for each  $x \in U$ .

Note An alternate approach is to define the inverse of the map  $\lambda$ , denoted  $\lambda^\vee$ , first by

$$\lambda^\vee: U \times \mathbb{R}^n \rightarrow TU : (x, v) \mapsto v_x$$

where  $v_x \in T_x U$  is given by

$$v_x(f) := \frac{d}{dt}|_{t=0} f(x+tv).$$

### Exercise 4.9

Let  $U \subset \mathbb{R}^n$  and  $V \subset \mathbb{R}^m$  be open sets and  $\underline{\Phi} \in C^\infty(U, V)$ . Under the identification  $\overline{TU} \cong U \times \mathbb{R}^n$  and  $\overline{TV} \cong V \times \mathbb{R}^m$ , show that the tangent map  $\overline{T\underline{\Phi}}: \overline{TU} \rightarrow \overline{TV}$  is given by

$$\overline{T\underline{\Phi}}(x, v) = (\underline{\Phi}(x), D\underline{\Phi}(x)v) \quad \forall x \in U, v \in \mathbb{R}^n,$$

where  $D\underline{\Phi}(x)$  is the usual derivative, that is

$$D\underline{\Phi}(x) \cdot v = \frac{d}{dt} \Big|_{t=0} \underline{\Phi}(x + tv)$$

## Local Coordinates on TM

Given an atlas  $\mathcal{Q} = \{(U_\alpha, \varphi_\alpha) \mid \alpha \in J\}$  on a manifold  $M$ , the tangent maps

$$T\varphi_\alpha : TU_\alpha \rightarrow T\varphi(U_\alpha) \cong \varphi(U_\alpha) \times \mathbb{R}^n$$

↑  
identification from Exercise 4.8

are bijective (see Exercises 4.6 and 4.7), which allows us to represent a tangent vector locally as a pair

$$(x, v) = (x^\alpha, v^\alpha) \in \varphi(U_\alpha) \times \mathbb{R}^n$$

of  $n$ -dimensional vectors. In this way the pair  $(TU_\alpha, T\varphi_\alpha)$  defines a chart on  $M$ .

Since we also have that

$$TM = \bigcup_{\alpha \in J} TU_\alpha$$

and

$$T\varphi_\beta \circ (T\varphi_\alpha)^{-1} = T\varphi_\beta \circ T\varphi_\alpha^{-1} = T(\varphi_\beta \circ \varphi_\alpha^{-1}) \in C^\infty(\varphi_\alpha(U_\alpha \cap U_\beta), \varphi_\beta(U_\alpha \cap U_\beta))$$

↑ by Exercise 4.7      ↑ by Proposition 4.5      ↑ by Exercise 4.9

for all  $\alpha, \beta \in J$ , it follows

$$T\mathcal{Q} := \{(TU_\alpha, T\varphi_\alpha) \mid \alpha \in J\}$$

defines an atlas on  $M$  providing it with the structure of a  $2n$ -dimensional smooth manifold.

Definition 4.10 A vector bundle of rank K

over a manifold  $M$  is a pair  $(E, \pi)$

consisting of a manifold  $E$  and a smooth map

$$\pi: E \rightarrow M$$

such that for each  $p \in M$ , there exist an open neighborhood  $U$  of  $p$  and a diffeomorphism

$$\varphi: \pi^{-1}(U) \rightarrow U \times \mathbb{R}^K,$$

which, when restricted to the fibre

$$E_p := \pi^{-1}(p),$$

defines a bijective map

$$\varphi|_{E_p}: E_p \rightarrow \{p\} \times \mathbb{R}^K.$$

Note: The bijection  $\varphi|_{E_p}$  endows  $E_p$  with the structure of a vector space.

Terminology The map  $\varphi: E_p = \pi^{-1}(p) \rightarrow U \times \mathbb{R}^K$  is called a (local) trivialization of  $E$  over  $U$ .

The pair  $(E_p, \varphi)$  is referred to as a vector bundle chart.

## Theorem 4.11 (Inverse Function Theorem)

Suppose  $f \in C^\infty(M, N)$  and  $p \in M$ . Then

$$T_p f: T_p M \rightarrow T_{f(p)} N$$

is a (linear) isomorphism if and only if there exists a neighborhood  $U$  of  $p$  such that

$$f|_U: U \subset M \rightarrow f(U) \subset N$$

is a diffeomorphism.

Proof Inverse Function Theorem from calculus.

Definition 4.12 Let  $f \in C^\infty(M, N)$  be a smooth map. Then  $f$  is called

(i) a submersion at  $p$  if  $T_p f: T_p M \rightarrow T_{f(p)} N$  is surjective, (This is also known as a regular point)

(ii) an immersion at  $p$  if  $T_p f: T_p M \rightarrow T_{f(p)} N$  is injective, and

(iii) a local diffeomorphism at  $p$  if  $T_p f: T_p M \rightarrow T_{f(p)} N$  is an isomorphism.

We further say that  $f$  is

- (i') a submersion if it is a submersion at every  $p \in M$ ,
- (ii') an immersion if it is an immersion at every  $p \in M$ , and
- (iii') a local diffeomorphism if it is a local diffeomorphism at every  $p \in M$ .

Finally, we say that  $p \in M$  is a critical point for  $f$  if  $f$  is not a submersion at  $p$  (i.e.  $p$  is not a regular point of  $f$ .)

### Example 4.13

(i) The map

$$f: \mathbb{R} \longrightarrow S^1 \subset \mathbb{C} : x \mapsto e^{ix}$$

is a local diffeomorphism, but not a diffeomorphism.

(ii) The map

$$f: \mathbb{R}^2 \longrightarrow S^1 \subset \mathbb{C} : (x, y) \mapsto e^{ix}$$

is a submersion.

(iii) The map

$$f: \mathbb{R} \longrightarrow S^1 \times S^1 \subset \mathbb{C}^2 : x \mapsto (e^{ix}, 1)$$

is an immersion

## Theorem 4.14

Suppose  $f \in C^\infty(M, N)$ ,  $p_0 \in M$ , and  $f$  is a submersion at  $p_0$ . Then there exists a coordinate chart  $(V, \psi)$  containing  $f(p_0)$ , and a coordinate chart  $(U, \varphi)$  containing  $p_0$  such that  $\varphi(U) \subset V$  and the local representation  $\tilde{f} = \psi \circ f \circ \varphi^{-1}$  is given by

$$\tilde{f}_{\psi\varphi}(x^1, \dots, x^n, x^{n+1}, \dots, x^m) = (x^1, \dots, x^n)$$

for all  $(x^1, \dots, x^m) \in \varphi(U)$ .

Proof Implicit Function Theorem.

## Theorem 4.15

Suppose  $f \in C^\infty(M, N)$ ,  $p_0 \in M$ , and  $f$  is an immersion at  $p_0$ . Then there exists a coordinate chart  $(V, \psi)$  containing  $f(p_0)$ , and a coordinate chart containing  $p_0$  such that  $\varphi(V) \subset V$  and the

local representation  $\tilde{f} = \psi \circ f \circ \varphi^{-1}$  is given by

$$\tilde{f}_{\psi\varphi}(x^1, \dots, x^m) = (x^1, x^2, \dots, x^m, 0, \dots, 0)$$

for all  $(x^1, \dots, x^m) \in \varphi(U)$ .

Proof Implicit Function Theorem.

### Corollary 4.16 (Local normal form for submersions)

Suppose  $f \in C^\infty(M, N)$  is a submersion, and  $P_0 \in M$ . Given any coordinate chart  $(V, \varphi)$  containing  $f(P_0)$ , there exists a coordinate chart  $(U, \psi)$  containing  $P_0$  such that the local representation  $\tilde{f}_{\varphi\psi} = \varphi \circ f \circ \psi^{-1}$  is given by

$$\tilde{f}_{\varphi\psi}(x^1, \dots, x^n, x^{n+1}, \dots, x^m) = (x^1, \dots, x^n)$$

for all  $(x^1, \dots, x^m) \in \psi(U)$ .

Proof Follows directly from Theorem 4.14. □

### Corollary 4.17 (Local normal form for immersions)

Suppose  $f \in C^\infty(M, N)$  is an immersion, and  $P_0 \in M$ . Given any coordinate chart  $(V, \varphi)$  containing  $f(P_0)$ , there exists a coordinate chart  $(U, \psi)$  containing  $P_0$  such that the

local representation  $\tilde{f} = \varphi \circ f \circ \psi^{-1}$  is given by

$$\tilde{f}_{\varphi\psi}(x^1, \dots, x^m) = (x^1, x^2, \dots, x^m, 0, \dots, 0)$$

for all  $(x^1, \dots, x^m) \in \psi(U)$ .

Proof Follows directly from Theorem 4.15 □

Theorem 4.18 Suppose  $f \in C^\infty(M, N)$  is a submersion. Then each level set  $f^{-1}(q)$ ,  $q \in N$ , is a submanifold of dimension  $\dim M - \dim N$ .

Proof (Hw : Provide a proof. Use Theorem 4.16)

Theorem 4.19 Suppose  $f \in C^\infty(M, N)$  is an immersion. Then for each  $p_0 \in M$ , there exists a neighborhood  $U$  of  $p_0$  such that  $S = f(U)$  is a submanifold of dimension  $\dim N - \dim M$ .
