

Presentation:

GAODE and HAODE:

Two Proposals based on AODE to Deal with Continuous Variables

International Conference on Machine Learning 2009
on 15/06/2009

M. Julia Flores, José A. Gámez, Ana M. Martínez and José M. Puerta

Motivation

Conditional Gaussian Networks

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

Naive Bayes classifier

- The attributes are conditionally independent given the class value $I(A_i, A_j|C)$.

$$c_{MAP} = \underset{c \in \Omega_C}{\operatorname{argmax}} p(c) \prod_{i=1}^n p(a_i|c)$$

- **Time complexity:**
 - **Training:** $\mathcal{O}(tn)$
 - **Classification:** $\mathcal{O}(kn)$
- **Problems:**
 - ✗ : It does not work properly in certain datasets.
 - ✗ : Dependences between attributes reduce, unavoidable, the prediction capability of NB.
 - ✗ : Not only interesting to be right in the classification in certain applications.

Motivation

Conditional Gaussian Networks

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

- **AODE** is significantly better in terms of error reduction compared to the rest of semi-naïve techniques.

- **MAP hypothesis:**

$$\operatorname{argmax}_{c \in \Omega_C} \left(\sum_{j=1, N(a_j) > m}^n p(c, a_j) \prod_{i=1, i \neq j}^n p(a_i | c, a_j) \right)$$

Motivation

Conditional Gaussian Networks

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

- Time complexity:
 - Training: $\mathcal{O}(tn^2)$
 - Classification: $\mathcal{O}(kn^2)$
- Drawbacks:
 - ✗ : Quadratical order time in classification.
 - ✗ : High demand of RAM memory.
 - ✗ : **Only discrete variables.**
- Attempts to improve AODE's **accuracy**
 - **WAODE**: Model weighting with $IM(\mathbf{C}, \mathbf{A}_j)$.

ECSQARU 09

- A BN assume **all** the variables are **discrete**.
- **Large amount of methods** developed to solve problems with **discrete variables**.
- It is common the **coexistence** of **discrete** and **continuous** variables in the same problem.
- Direct solution → **discretization**.
 - ✗ : Unavoidable lost of precision.
 - ✗ : Which discretization method should we choose?.
- Some alternative solutions:
 - 1 **Conditional Gaussian Networks.**
 - 2 **Kernel-based distributions.**
 - 3 **Mixtures of truncated exponentials.**

Outline

- 1 Motivation
- 2 **Conditional Gaussian Networks**
- 3 **New proposals to deal with numeric attributes in AODE**
 - Gaussian AODE (GAODE) classifier
 - Hybrid AODE (HAODE) classifier
- 4 **Experimental Methodology and Results**
 - Datasets with only continuous attributes
 - Hybrid Datasets
- 5 **Conclusions and Future Work**

- Every **continuous variable** X is modeled with a **conditional Gaussian distribution**.

$$f(X|\mathbf{Y} = y, \mathbf{Z} = z; \Theta) = \mathcal{N}(x : \mu_X(y) + \sum_{j=1}^s b_{XZ_j}(y)(z_j - \mu_{Z_j}(y)), \sigma_{X|\mathbf{Z}}^2(y))$$

- $b_{XZ_j}(y)$, **regression term** that measures the strength of the connection between X and every continuous parent.
- $\sigma_{X|\mathbf{Z}}^2(y)$ is the **conditional variance** of X over its continuous parents.

Motivation

Conditional Gaussian Networks

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

Factorization of the joint density function in a SPODE network

Structure

Local densities

$$\begin{aligned} \Theta_c &= (CPT) & f_C &\sim P(C) \\ \Theta_j &= (\mu_j(c), -, \sigma_j(c)) & f_{A_j|C=c} &\sim \mathcal{N}(\mu_j(c), \sigma_j(c)) \\ \Theta_1 &= (\mu_1(c), b_1(c), \sigma_{1|j}(c)) & f_{A_1|C=c, A_j=a_j} &\sim \mathcal{N}(\mu_1(c) + b_{1j}(c)(a_j - \mu_j(c)), \sigma_{1|j}(c)) \\ \Theta_j &= (\mu_j(c), b_j(c), \sigma_{j|j}(c)) & f_{A_j|C=c, A_j=a_j} &\sim \mathcal{N}(\mu_j(c) + b_{jj}(c)(a_j - \mu_j(c)), \sigma_{j|j}(c)) \\ \Theta_n &= (\mu_n(c), b_n(c), \sigma_{n|j}(c)) & f_{A_n|C=c, A_j=a_j} &\sim \mathcal{N}(\mu_n(c) + b_{nj}(c)(a_j - \mu_j(c)), \sigma_{n|j}(c)) \end{aligned}$$

Factorization of the joint density function

$$f(c, a_j, a_1, \dots, a_j, \dots, a_n) = p(c) \frac{1}{\sqrt{2\pi}\sigma_j(c)} e^{-\frac{1}{2} \left(\frac{a_j - \mu_j(c)}{\sigma_j(c)} \right)^2} \cdot \frac{1}{\sqrt{2\pi}\sigma_{i|j}(c)} e^{-\frac{1}{2} \left(\frac{a_i - (\mu_i(c) + b_{ij}(a_j - \mu_j(c)))}{\sigma_{i|j}(c)} \right)^2} \dots \frac{1}{\sqrt{2\pi}\sigma_{n|j}(c)} e^{-\frac{1}{2} \left(\frac{a_n - (\mu_n(c) + b_{nj}(a_j - \mu_j(c)))}{\sigma_{n|j}(c)} \right)^2}$$

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

- Application of **CGN** to the children's distributions:
 - The density function just has a **discrete parent node (C)** and a **continous parent node**, which is the superparent on each model (**A_j**).

$$f(A_i = a_i | C = c, A_j = a_j) = \mathcal{N}(a_i : \mu_i(c) + b_{ij}(c)(a_j - \mu_j(c)), \sigma_{ij}^2(c))$$

- **MAP hypothesis:**

$$\operatorname{argmax}_c \left(\sum_{j=1}^n \mathcal{N}(a_j : \mu_j(c), \sigma_j^2(c)) p(c) \prod_{i=1 \wedge i \neq j}^n \mathcal{N}(a_i : \mu_i(c) + b_{ij}(c)(a_j - \mu_j(c)), \sigma_{ij}^2(c)) \right)$$

Motivation

Conditional Gaussian Networks

New proposals

Gaussian AODE (GAODE) classifier

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

- **Time complexity:**
 - The same as AODE (incremental computation of parameters).
 - **Space complexity:**
 - **Training & Classification:** $\mathcal{O}(kn^2)$ (independent from v).
- ✓ Probabilities estimated can be more reliable comparing to the multinomial version as they are modeled from more samples, especially with large CPTs.
- ✗ : Not possible to define the corresponding probability function for a discrete variable conditioned to a numeric attribute. **Restricted to Numerical datasets.**

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

- **Discrete** superparents (\mathbf{A}_j) in its corresponding models.
- **MAP hypothesis:**

$$\operatorname{argmax}_c \left(\sum_{j=1, N(\mathbf{a}_j) > m}^n p(\mathbf{a}_j, c) \prod_{i=1 \wedge i \neq j}^n \mathcal{N}(\mathbf{a}_i : \mu_i(c, \mathbf{a}_j), \sigma_i^2(c, \mathbf{a}_j)) \right)$$

- **Time complexity:**
 - **The same as AODE** (incremental computation of parameters).
 - **Space complexity:**
 - **Training & Classification:** The same as AODE $\mathcal{O}(k(nv)^2)$ in the worst of the cases.
- ✓ Able to deal with **hybrid datasets** too.

Experimental framework

- Experiments over the **26 numeric datasets** for clasification, downloaded from the Weka home page and original from the UCI repository.
- 5x2cv for the evaluation process.
- 5x2 cv F Test with a 95 %.
- Supervised discretization for NB, AODE and HAODE's superparents.
 - Fayyad and Irani's MDL method.
 - Further experiments have been performed with different discretization methods, and the results obtained follow the same tendency.

Hybrid AODE (HAODE) classifier

Experimental Methodology and Results

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

What happen in hybrid datasets?

- Results summary:
 - **HAODE-ties-AODE**: 1 – 10 – 5.
 - *Wilcoxon test*: No statistical difference.
- **Why?**
 - No significant pattern found when the percentage of numerical variables with respect to discrete ones was analyzed.
 - Apparent tendency of HAODE to **punish datasets with missing values**. Statistical difference (Wilcoxon) when only datasets with missing values are considered.
 - Results summary after applying an **unsupervised filter to replace missing values**: 2 – 12 – 2.

Datasets with only continuous attributes

Hybrid Datasets

Conclusions and Future Work

Conclusions and Future Work

- In this paper we propose two alternatives to AODE to deal with continuous attributes.
- **GAODE**: applies CGNs.
 - ✓ **Competitive results** comparing to AODE (5 – 16 – 5).
 - ✓ **Reduction** in the **space complexity**.
 - ✓ Maintains AODE's time complexity.
 - ✓ Can entail a more reliable computation of statistics, only class conditioned.
 - ✗ : Restricted to continuous datasets.
- **HAODE**: discretizes the superparents.
 - ✓ **Significantly better** than AODE in continuous datasets (6 – 19 – 1).
 - ✓ Able to deal with **all kind of datasets**.
 - ✗ : Clear preference for datasets with continuous attributes and absence of missing data.
- As future line of work: application of Kernel-based distributions, **Mixtures of Truncated Exponentials** (MTEs) and other approaches.
