# Quantifying Components of the SACH (Step 1)

## Step 1: Modelling The Link Between “Traffic” and “Conflict” and “Severe Conflict”

- Researchers have developed several conflict techniques to find out the number and severity of conflicts using micro-simulation model ([Hyden 1987](#); [Hyden 1996](#); [Archer 2005](#)).
- After generating individual vehicle movement, the conflicts could be determined using probabilistic human behaviour models such as lane changing, car following, gap acceptance and stop-or-go decision at the onset of amber ([Archer 2005](#); [Cunto and Saccomanno 2008](#); [Archer and Young 2009](#)).

# Quantifying Components of the SACH (Step 2)

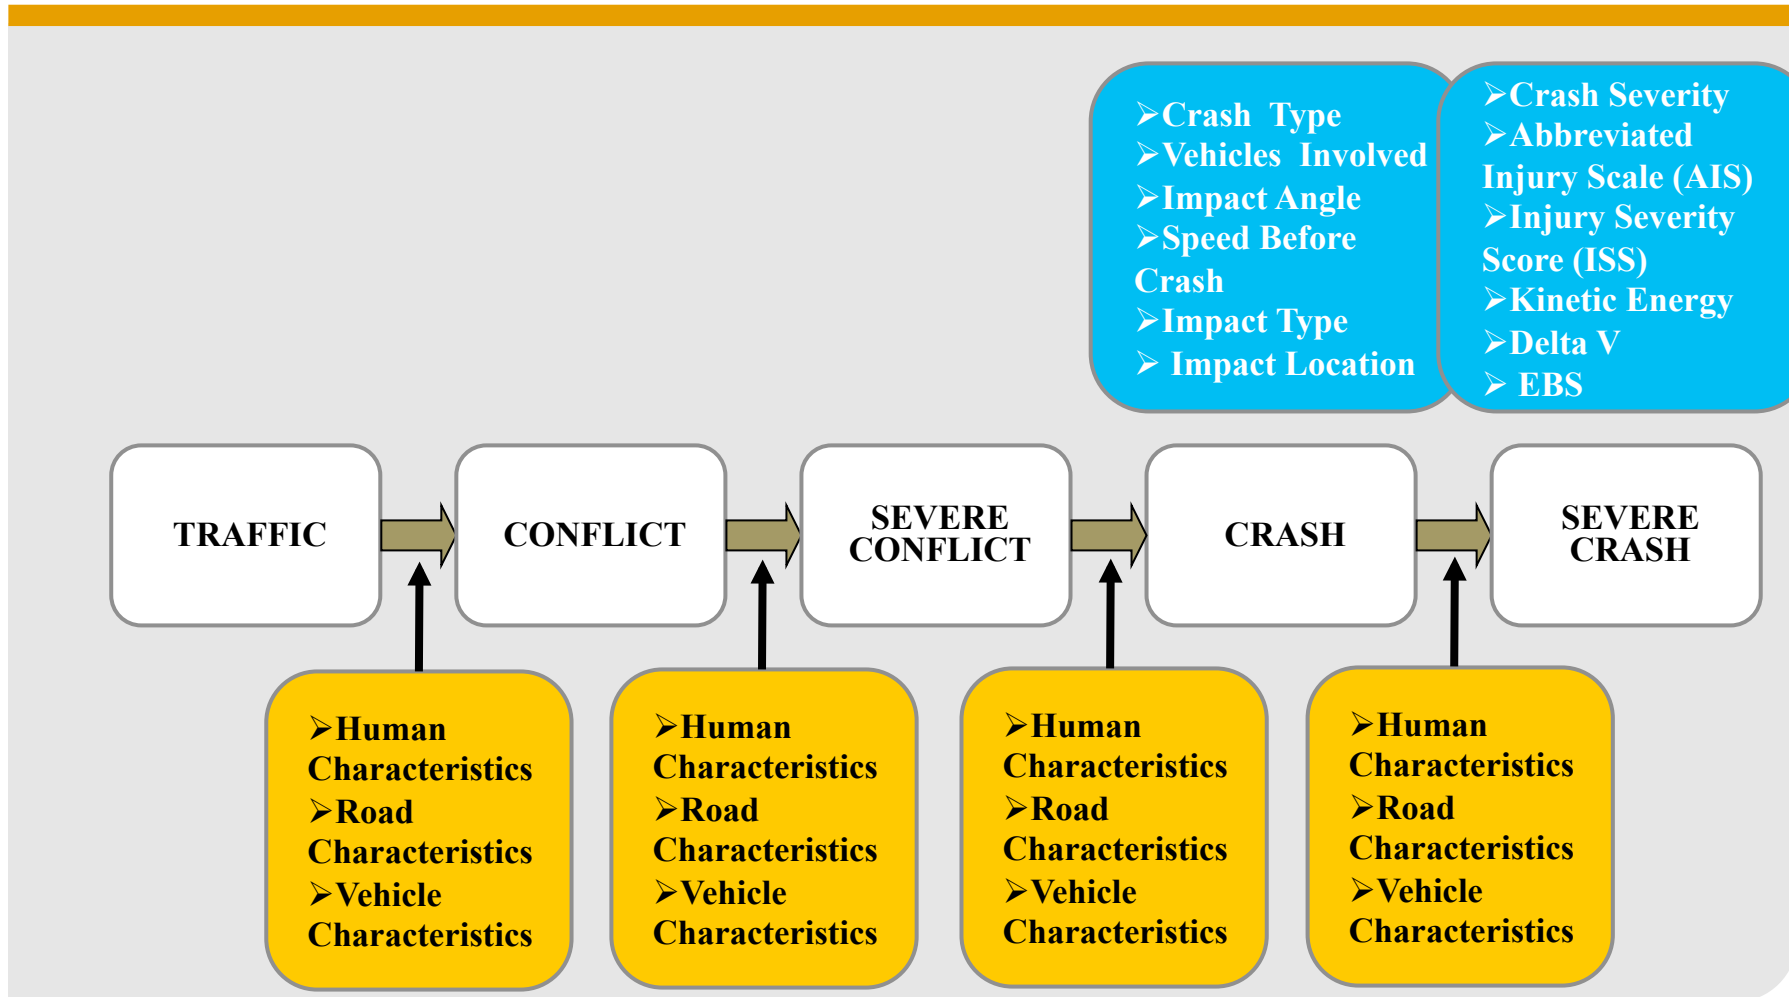

**Step 1:** Modelling The Link Between “Traffic” and “Conflict” and “Severe Conflict”

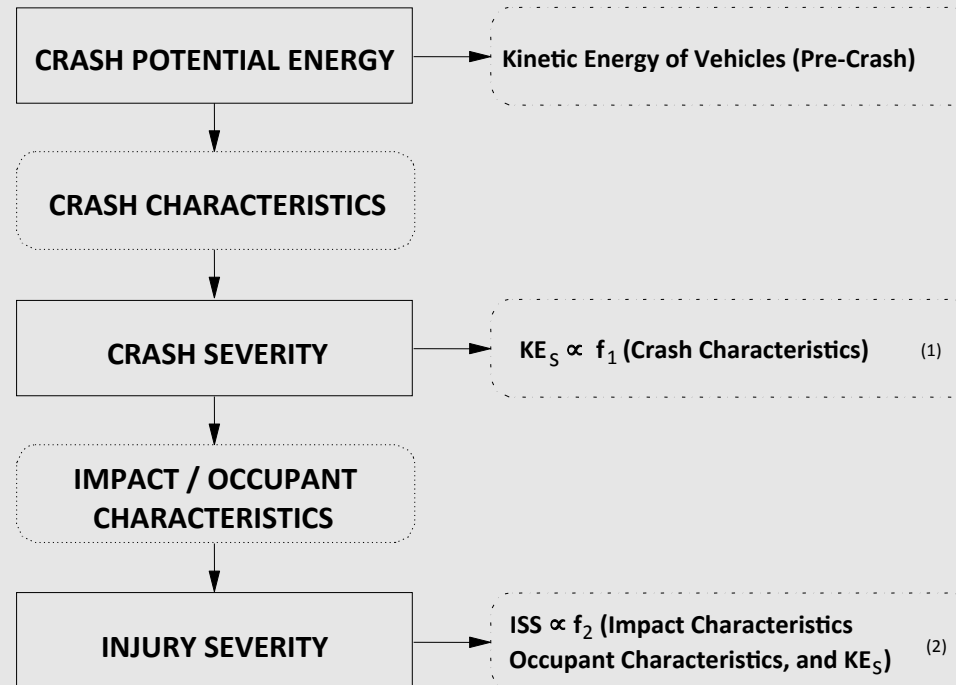

**Step 2:** Modelling The Link Between “Crash” and “Severe Crash”

# Quantifying Components of the SACH (Step 2)

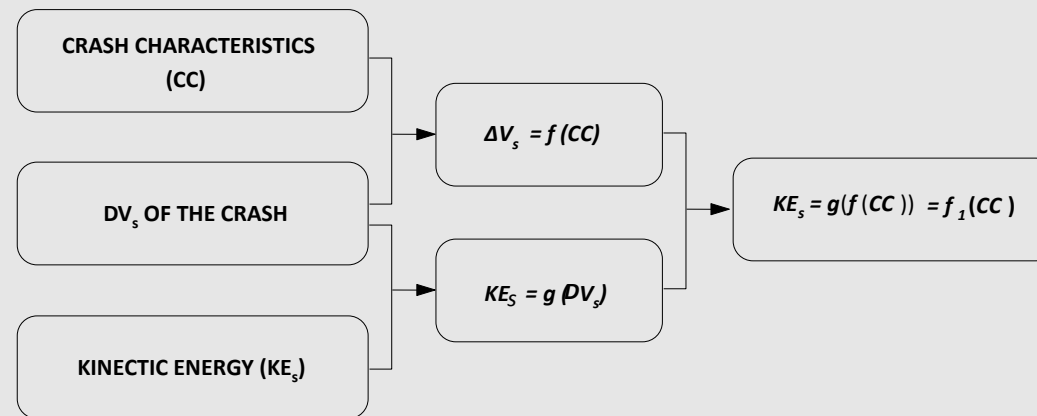

# Quantifying Components of the SACH (Step 2)

- (1)  $f_1$  is the mathematical model presenting the kinetic energy transferred to the subject vehicle in crash according to crash characteristics
- (2)  $f_2$  is the mathematical model presenting the ISS of the crash according to impact characteristics, kinetic energy transferred to the subject vehicle and occupant characteristics.

# Quantifying Components of the SACH (Step 2)

$$\Delta V_s = v_s^b - v_s^a = \frac{m_b}{m_s} \left[ v_b^a \left( \cos \alpha_b^a + \frac{\sin \alpha_b^a}{\sin \alpha_s^a} - \frac{\sin \alpha_b^a}{\tan \alpha_s^a} \right) - v_b^b \left( \frac{\sin(PDOF)}{\sin \alpha_s^a} + \cos(PDOF) - \frac{\sin(PDOF)}{\tan \alpha_s^a} \right) \right]$$

# Quantifying Components of the SACH (Step 3)

**Step 1:** Modelling The Link Between “Traffic” and “Conflict” and “Severe Conflict”

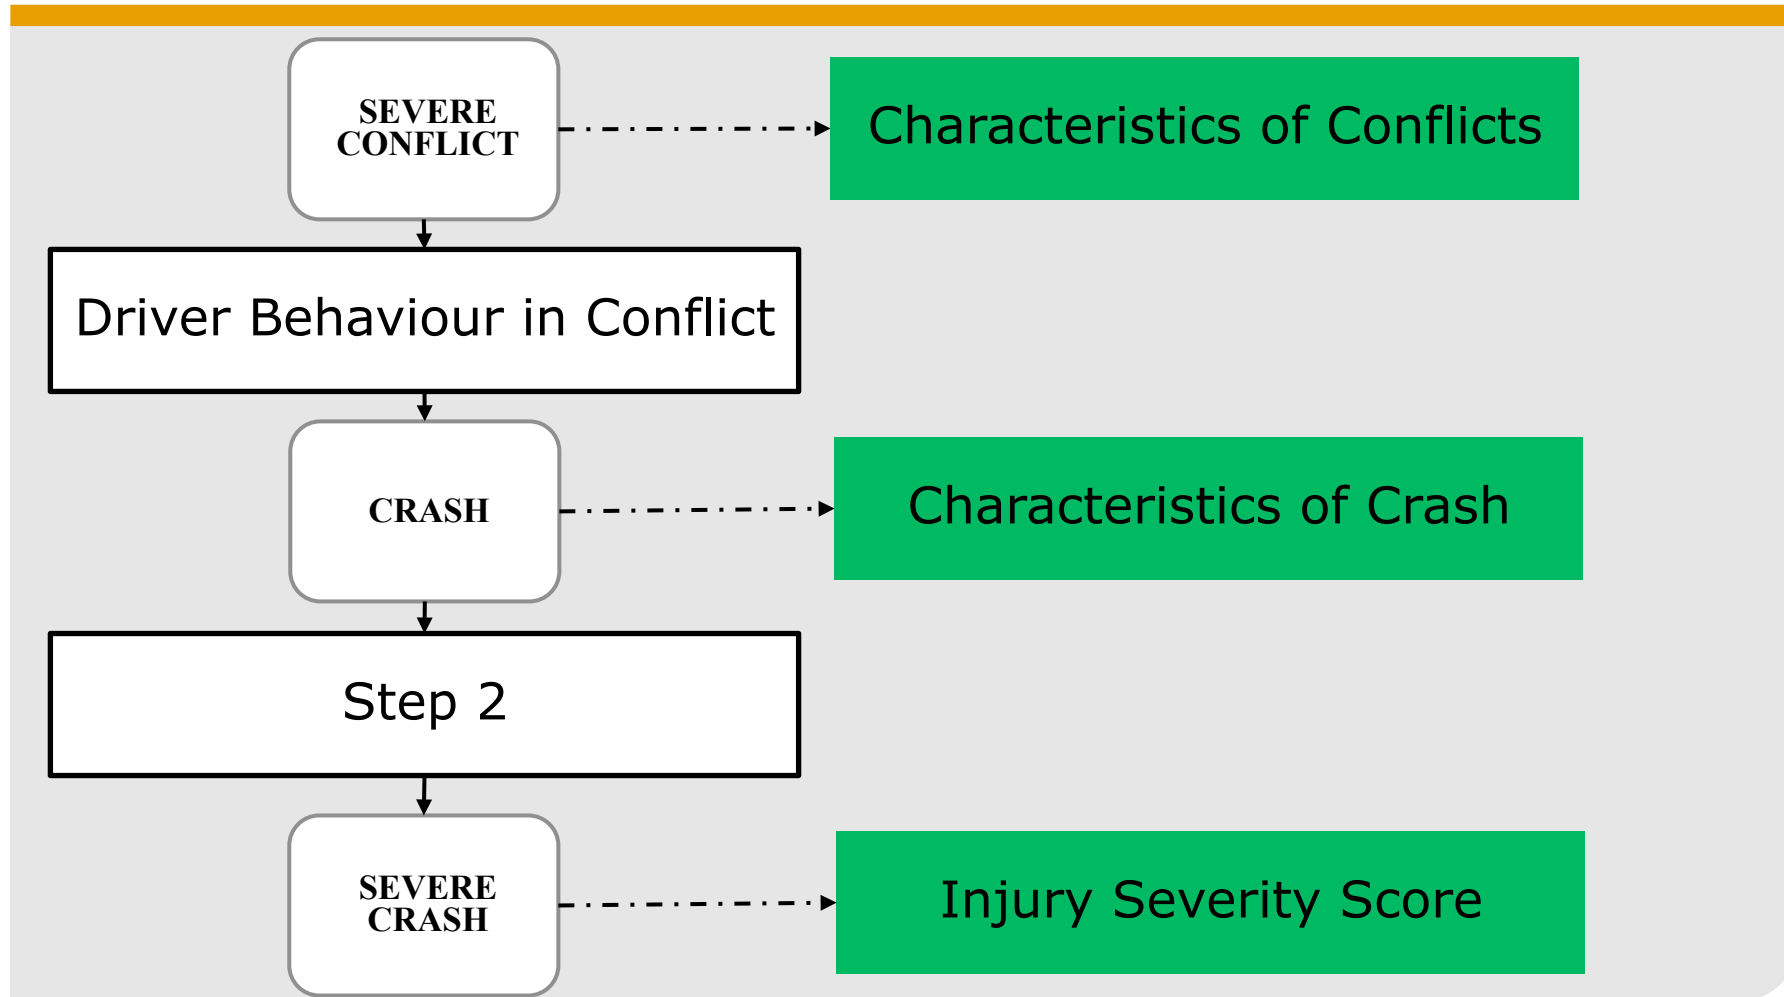

**Step 2:** Modelling The Link Between “Crash” and “Severe Crash”

**Step 3:** Modelling The Link Between “Severe Conflict” and “Crash”

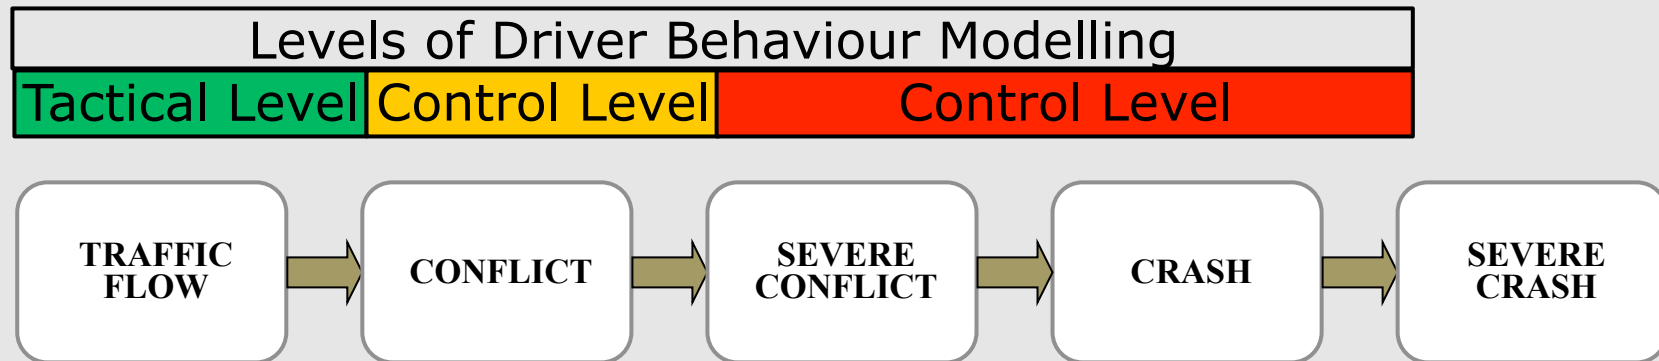

# Quantifying Components of the SACH (Step 3)

# Quantifying Components of the SACH (Step 3)

# Quantifying Components of the SACH (Step 3)

**Step 1:** Modelling The Link Between “Traffic” and “Conflict” and “Severe Conflict”

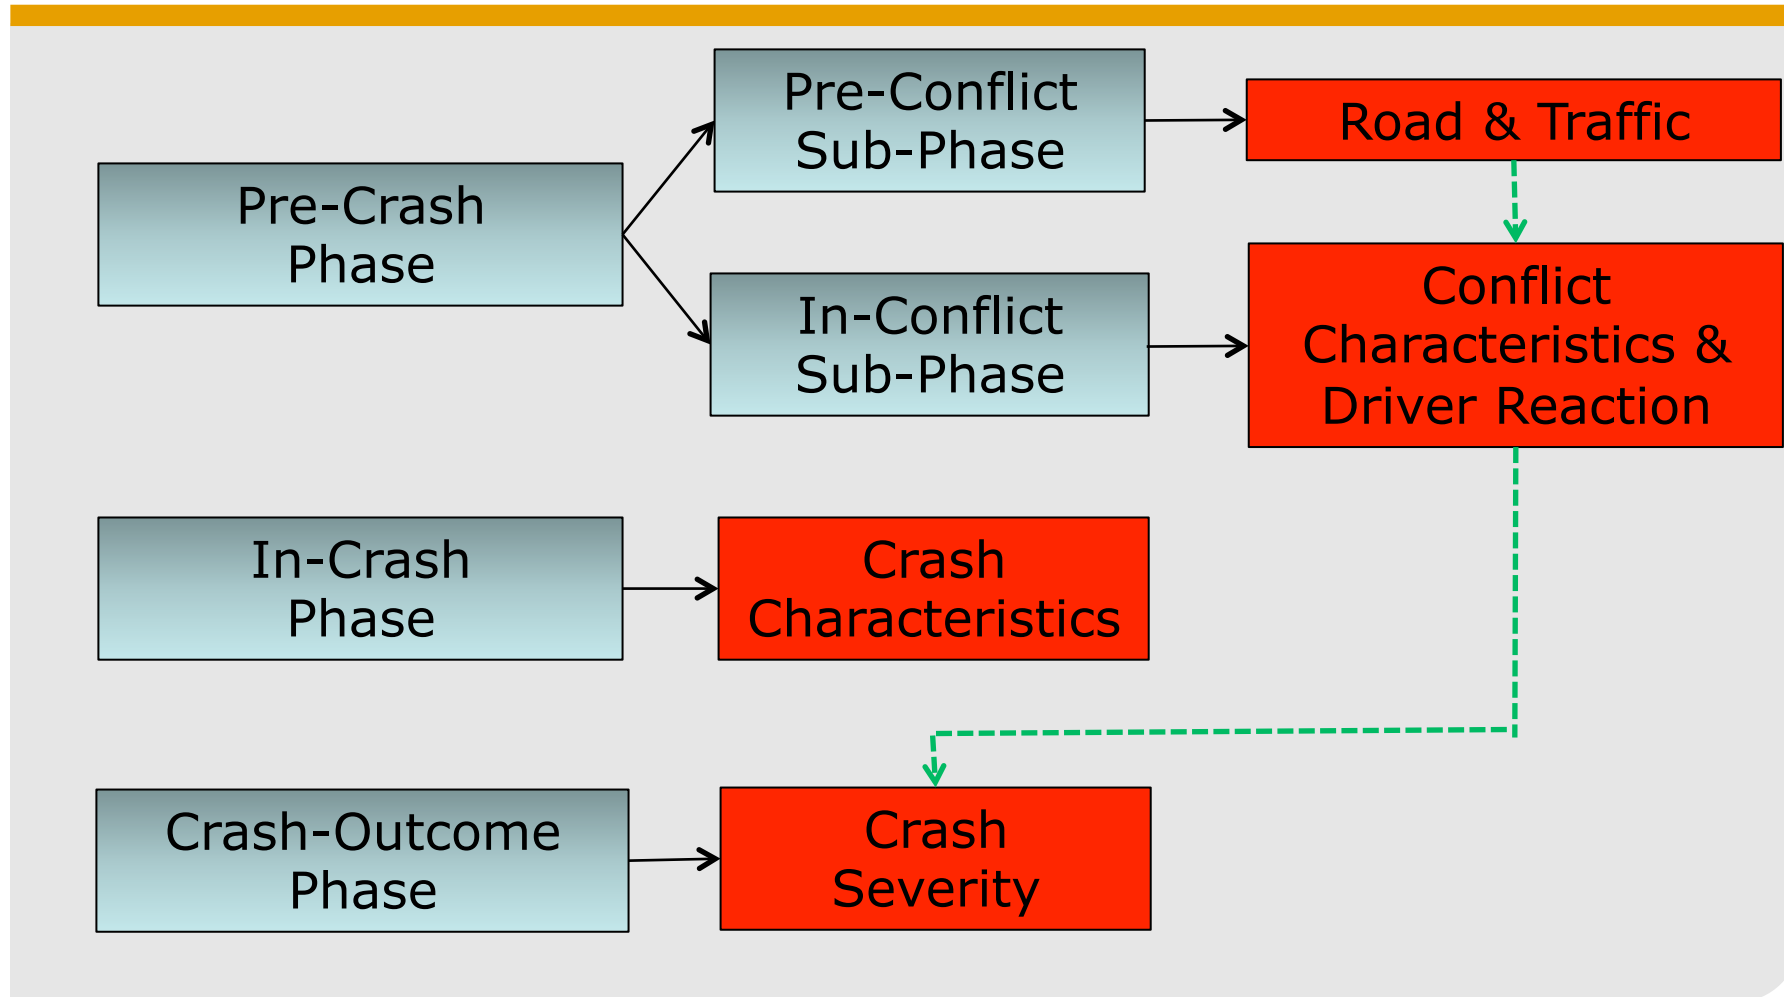

**Step 2:** Modelling The Link Between “Crash” and “Severe Crash”

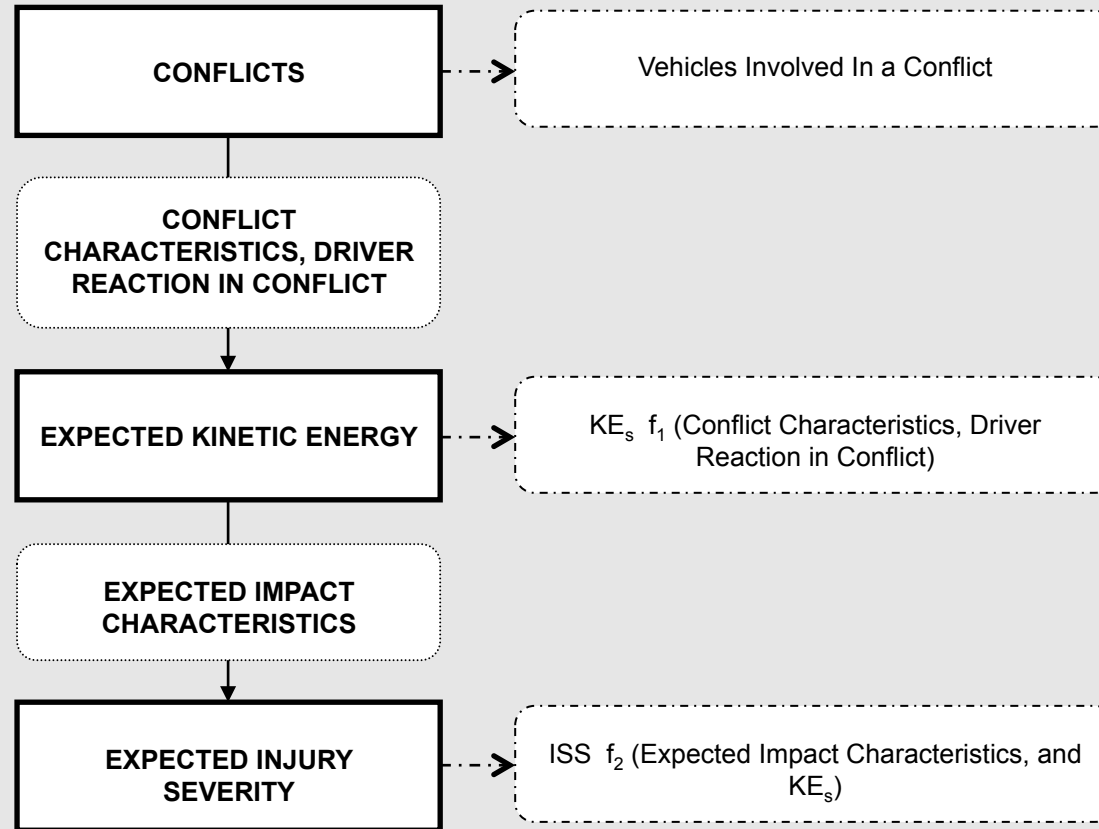

**Step 3:** Using an Alternative Model

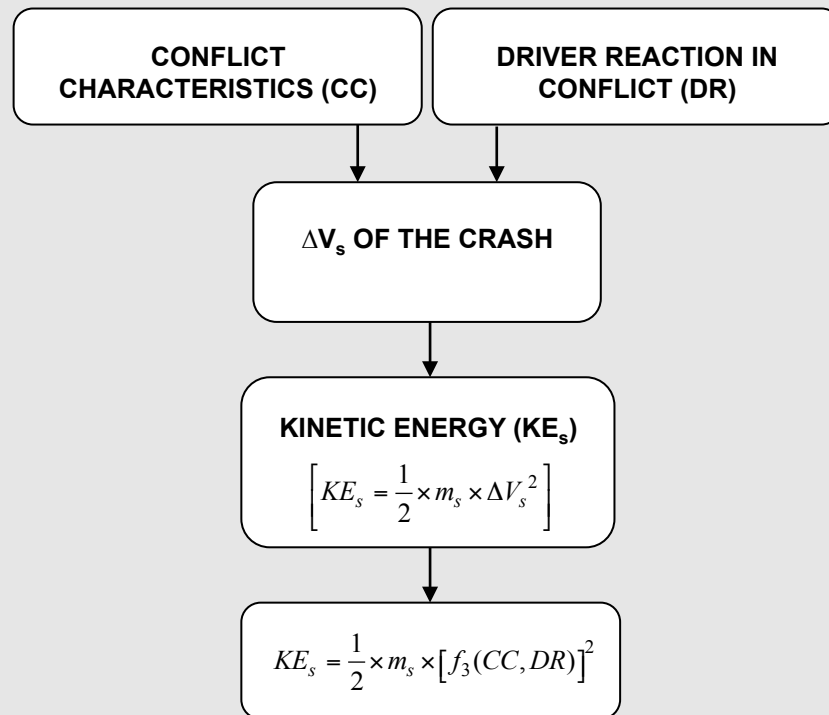

# Quantifying Components of the SACH (Step 3)

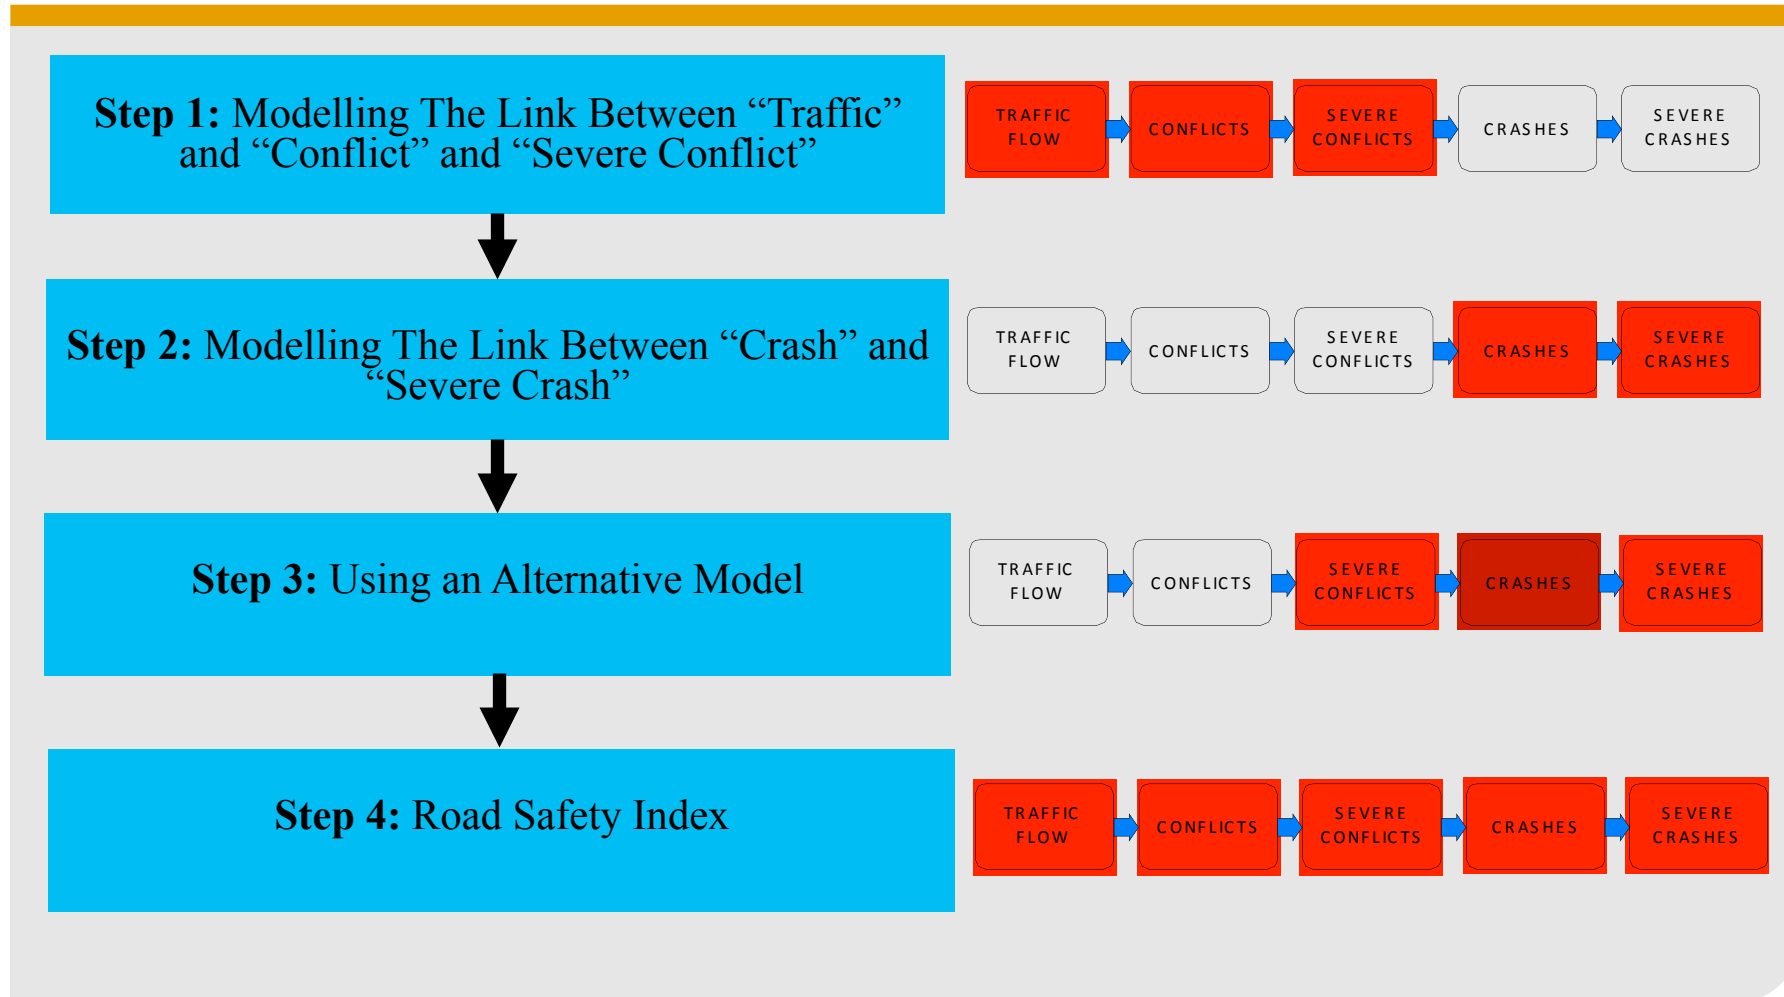

## Quantifying SACH (Step 3)

- **Future Research**
- **Conclusion**

# Conclusion

- **A Safety Analysis Chain (SACH) has been introduced as a basis for assessing safety performance of roads.**
- **A method has been outlined to quantify the components of the SACH through integrating the preceding safety modelling perspectives.**
- **The proposed theoretical framework proposed takes an important step towards the evaluation of the safety performance of roads.**
- **The SACH framework is a key for future research in road safety modelling since it provides a general overview of the main components of road safety modelling.**
