

Gravitational-wave cosmology over 29 decades in frequency

Paul Lasky

Time-of-arrival residual (μs)

Supermassive black hole mergers

- ◉ Assume all galaxies host a SMBH
- ◉ Use observed BH-Galaxy mass relations
- ◉ Assume BH merger rate traces galaxy merger rate
- ◉ Assume GW dominated mergers (circular, ...)
- ◉ ...
- ◉ Sum up contribution from all SMBHs mergers in Universe

- all binaries have circular orbits
- all binaries driven through band by GW emission

PSR J1909-3744

$$f = 339.31568728824556 \pm 0.00000000000000016 \text{ Hz}$$

$$\text{DM} = 10.4 \text{ pc cm}^{-3}$$

Shannon et al. (2015)

3 improvements

- longer baseline (+3yr)
- discrete phase offsets
- short λ obs. only

P_{model}	0.09	0.06	0.002	0.005
--------------------------	------	------	-------	-------

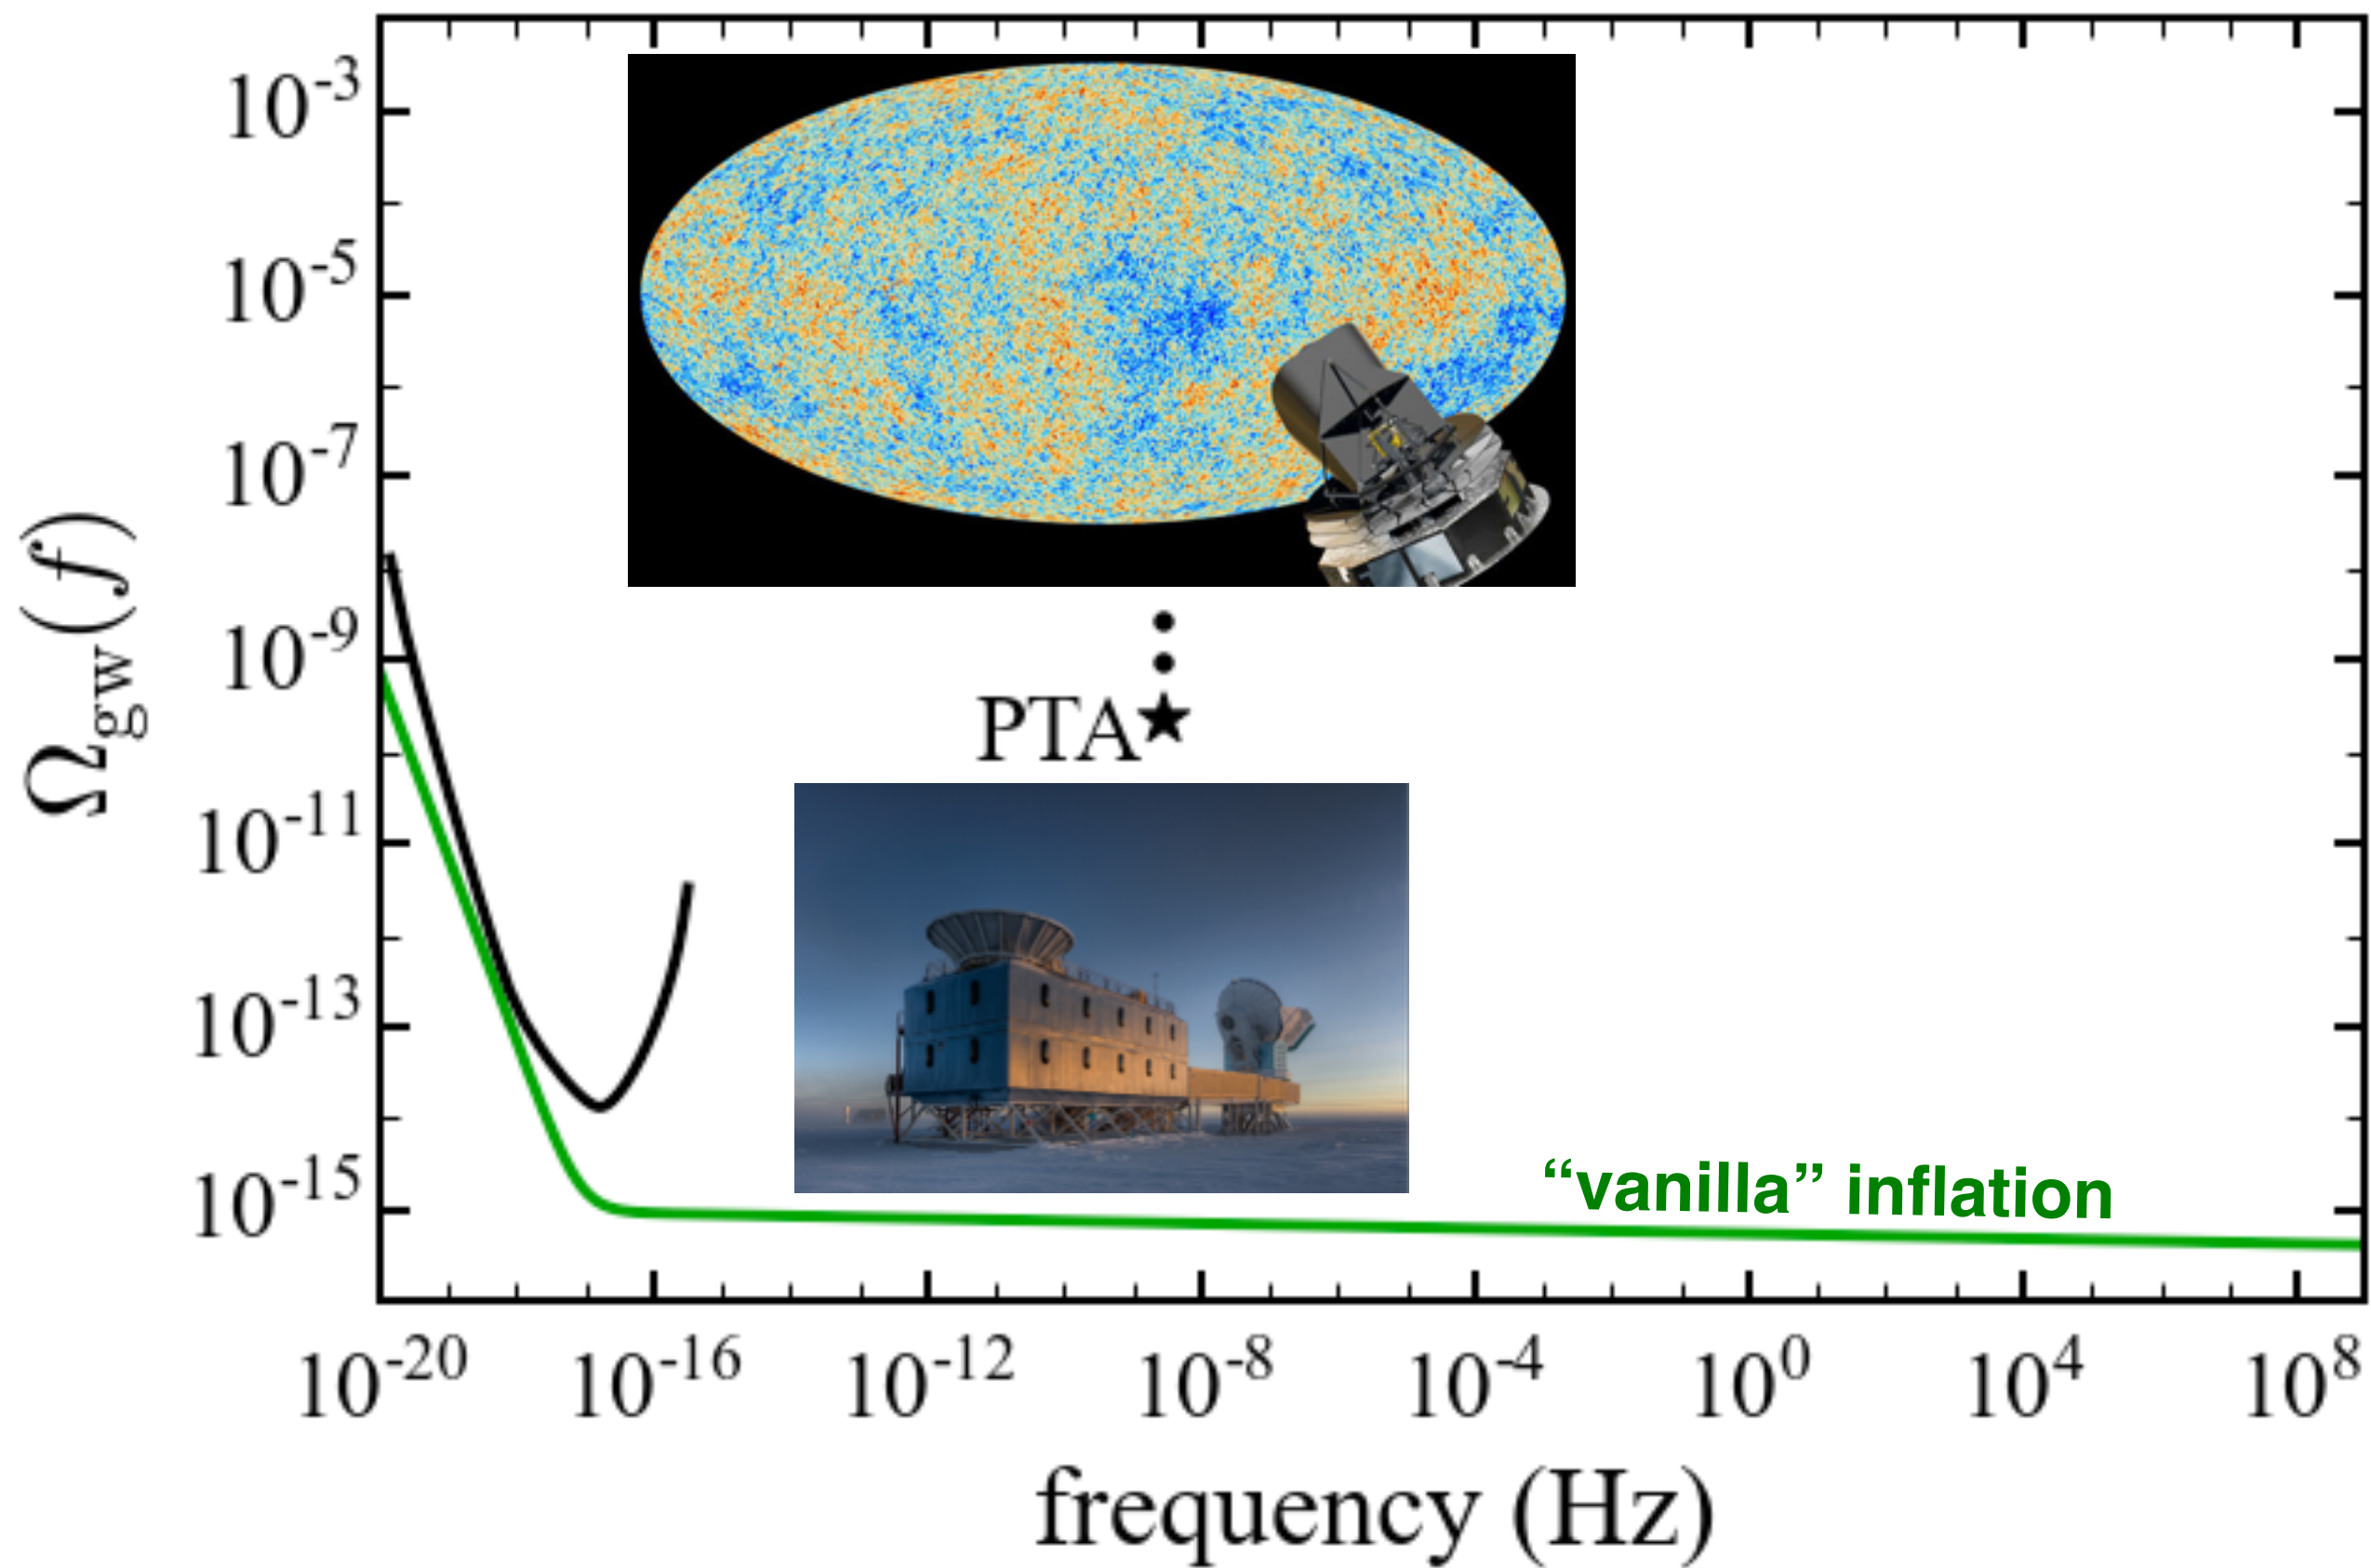

Astrophysical Inference

- Black hole mass function at $z \sim 2$?
- Galaxy merger rate?
- Environmental factors: stars, gas, ...

Thrane & Romano 2013

$\Omega_{\text{gw}}(f)$

$$\Omega_{\text{gw}} \propto r \left(\frac{f}{f_{\text{CMB}}} \right)^{n_t}$$

$\Omega_{\text{gw}}(f)$

$$\Omega_{\text{gw}} \propto r \left(\frac{f}{f_{\text{CMB}}} \right)^{n_t}$$

But... physics!?

Canonical inflation:

General relativity + spatially flat metric \longrightarrow red spectrum ($n_t < 0$)

Blue alternatives:

- ‘Super inflation’ (null energy violating field)
- string-gas cosmologies
- inflation with modified Einstein-Hilbert action
- ekpyrosis
- ...

Our philosophy:

‘Let’s let the data decide!’

Conclusions

- ◎ **PPTA currently doing cosmology with non-detections!**
 - ◎ Our understanding of galaxy/black hole evolution needs updating
 - ◎ excellent probe of galactic cores, including environment of binary system
- ◎ **Doing gravitational-wave cosmology over 29 decades in frequency!**
 - ◎ Only the combination of experiments can constrain this parameter space
 - ◎ Not clear how important this parameter space is to inflationary theorists:
 - ◎ they have very little experimental data!
 - ◎ (they have creative tendencies without data...)

Extra Slides

Is the final parsec problem solved?

sciencedaily.com

Stalled evolution:

- many binary systems
- rogue, isolated BHs from 3-body interactions

The Environment

Circular inspiral

GWs: $h_c \propto f^{-2/3}$

Stars: $h_c \propto f$

Gas: $h_c \propto f^{1/2}$

Where is the 'knee'?

need to understand:

- gas/stellar density in galactic cores?
- actual masses of supermassive BHs?
-

The Environment

non-zero eccentricities

GWs circularise orbits

some other effects drive eccentricity up:
e.g., retrograde circumbinary accretion, ...
